

Installing an Indoor Antenna

Your antenna can improve your Hub's mobile reception. Always use the adhesive base to stick it securely in place.

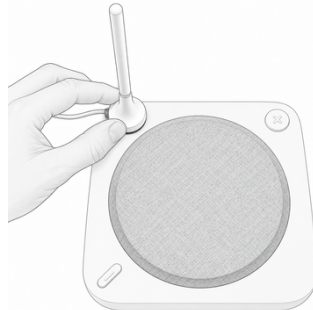

1 Connect the antenna

Screw the antenna cable connector onto the Antenna Port underneath your Hub. Turn it clockwise until firm. Do not force it.

2 Find the best spot for it.

Place the antenna high up near an external window or door. If this isn't practical, use the corner of your Hub, or the top of a wall-mounted Hub. Before sticking it down, check for a solid green or yellow Cellular Status light underneath your Hub. If it is red or flashing red, try another position.

3 Peel and stick

Make sure your chosen surface is clean and dry. Apply the double-sided adhesive to the bottom of the antenna. Peel off the remaining protective backing, then press the base firmly onto the surface. Check that it is stuck securely.

IMPORTANT: Do not leave the antenna loose, dangling or on the floor. This can worsen connectivity.

4 Check your alarm

Check the signal again. Press your pendant button to make a test call and tell the operator you are testing your alarm.
